

Customer Onboarding Guide

Connect your systems, models and tables — and go live in under a week.

This guide walks your team through connecting UNAI to your data platforms (Snowflake, Databricks, SAP, Oracle, Microsoft Fabric, Salesforce, Adobe), letting UNAI auto-discover your schemas, reviewing the proposed canonical mappings, and activating capabilities — all inside your own tenant, with read-only access first and write-back gated.

What you'll achieve

Connect → Auto-map → Review → Activate. No bespoke integration project; data never leaves your perimeter.

1 · What UNAI is, and how onboarding works

UNAI is one adaptive agent that does the work of many. It reads your systems through a single canonical ontology, so onboarding a new source is configuration — not coding.

The four steps

- Connect — grant UNAI read-only access to your platform's catalog (no data movement).
- Auto-map — UNAI inspects your tables/columns and proposes canonical mappings with a confidence score.
- Review — approve the high-confidence mappings; correct the few flagged for review (minutes to hours).
- Activate — switch on the supply-chain capabilities (read-only first; write-back gated).

1. Connect

>

2. Auto-map

>

3. Review

>

4. Activate

Time to value

- Lakehouse track (Snowflake / Databricks): typically live in under a week.
- SAP S/4HANA: connectivity is quick; write-back follows certification.

2 · What you need before you start

A read-only role on the source, network access from where UNAI runs, and an owner to approve the mappings. UNAI runs inside your tenant wherever possible.

Snowflake

A read-only role + warehouse; access to INFORMATION_SCHEMA. Install as a Snowflake Native App (runs in your account).

Databricks

Unity Catalog read grant; a SQL warehouse / serverless. Install as a Databricks App (runs in your workspace).

SAP S/4HANA

BTP destination or OData/RFC user (read); CDS view access. Write-back via gated BAPIs after certification.

Postgres / others

A read-only DB user + connection string; network route from the UNAI runtime.

Model access

One AI-gateway key (OpenRouter / LiteLLM / TrueFoundry / Bedrock) — UNAI does NOT need a key per model.

3 · Connecting each platform

Snowflake

1. Install the UNAI Native App from Marketplace (or your private listing).
2. Grant the app a read-only role on the target database/schema.
3. Run 'Introspect' — UNAI reads INFORMATION_SCHEMA + Horizon tags.
4. Review mappings, approve, activate. Data never leaves your account.

Databricks

1. Install the UNAI App into your workspace.
2. Grant Unity Catalog read on the catalog/schema.
3. Run 'Introspect' — UNAI reads information_schema + UC tags/lineage.
4. Review, approve, activate (serverless sandbox, UC-governed).

SAP S/4HANA

1. Expose CDS views / OData (read) via BTP Integration Suite.
2. Provide a read user or BTP destination; UNAI wraps these as MCP tools.
3. Introspect CDS annotations + DDIC; review mappings.
4. Activate read-only; enable gated BAPI write-back after certification.

4 · Reviewing & approving mappings

UNAI proposes a canonical concept for each column with a confidence score and a reason. High-confidence proposals are auto-accepted; the rest are queued for a quick human review.

Example (auto-discovered from a raw schema)

SOURCE COLUMN	CANONICAL	CONF	MODE
PRODUCT_KEY	sku	0.98	auto-accept
UNITS_AVAIL	on_hand_qty	0.92	auto-accept
VENDOR_NO	supplier	0.86	auto-accept
YRMO	period	0.80	review
ZZ_AUDIT	—	0.00	review

What to check

- Confirm the few 'review' rows (ambiguous names, custom Z-fields, legacy flags).
- Approved mappings persist to a versioned Mapping Registry and configure the agent.
- Re-run anytime when schemas change — UNAI only re-proposes what changed.

5 · Security, model access & FAQ

Security & data residency

- Runs inside your tenant (Snowflake Native App / Databricks App / your Kubernetes).
- Read-only first; write-back is gated by confidence + value thresholds, with human-in-the-loop.
- PII detected and redacted before any model call; full audit trail of every action.
- Responsible-AI guardrails are pre-packaged (injection screening, safety, policy).

Model access — one key, many models

Point UNAI at a single AI-gateway (OpenRouter / LiteLLM / TrueFoundry / Bedrock). You manage one credential; UNAI routes the cheap model for routine work and a premium model for hard reasoning — saving tokens and cost. No per-model keys to maintain.

FAQ

Q: Does our data leave our environment?

A: No — UNAI runs in your tenant; read-only by default.

Q: How long does onboarding take?

A: Lakehouse: under a week. SAP: quick to connect, write-back after certification.

Q: What if a mapping is wrong?

A: Correct it in review; the registry is versioned and improves over time.

Q: Do we need many API keys?

A: No — one AI-gateway key covers all models.
